

How to care

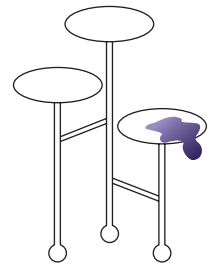

General Care

For routine cleaning ph-neutral soap and water is sufficient applied with a sponge or cloth. This is to be needed only 1-2 times a year, as this material is quite resistant to oxidation and retention of residue.

Spillages

Fingerprints can be easily moved using stainless steel cleaner. Stains and discoloration generally require the use of pad to brighten the material and then the application of stainless steel cleaner to help protect the stainless steel. Often, such heavy cleaning won't be necessary with the maintenance outlined above.

Maintaining Sheen

Polish/Cleaners are also suitable. Incorrect cleaners can cause staining or corrosion. Acid based products must not be used. When cleaning use a nylon or other non-scratching scourer.
